

Truss Jib

Truss Jib - Truss jib's can actually be utilized to pick up, transport and position trusses. The attachment is designed to operate as an extended jib additional part along with a triangular or pyramid shaped frame. Usually, truss jibs are mounted on machinery like a skid steer loader, a compact telehandler or even a forklift making use of a quick-coupler accessory.

Older kind cranes which have deep triangular truss jibs are normally assemble and fastened utilizing bolts and rivets into standard open structural shapes. There are seldom any welds on these kind jibs. Each riveted or bolted joint is susceptible to corrosion and thus requires regular upkeep and check up.

Truss jibs are built with a back-to-back arrangement of lacing members separated by the width of the flange thickness of another structural member. This particular design causes narrow separation among the smooth exteriors of the lacings. There is limited access and little room to clean and preserve them against corrosion. Numerous bolts become loose and rust within their bores and must be replaced.
